AIKODEX · STADIUM CREATOR 2

Getting Started

Five minutes from import to a full stand of cheering fans. This guide covers the essentials; the Manual in the same folder goes into every setting in detail.

Every spectator is animated individually, with no GameObject or Animator per person.

Before you begin

Stadium Creator 2 needs **Unity 6.6 or newer** with the **Universal Render Pipeline**, on a graphics API with compute shader support. It was developed and tested on Windows (Direct3D 11); WebGL is not supported because it has no compute shaders. If your project already uses URP there is nothing else to install.

1 · Have a look at the demo

Open **Tools** ▸ **Stadium Creator 2** ▸ **Open Demo Scene** and press Play. You will see a curved wooden bleacher full of supporters. Select the **Stadium** object in the Hierarchy and click the mood buttons in the Inspector (Calm, Cheering, Celebrating…) to see the crowd react. The **Goal!** button triggers an eight-second celebration that ripples outwards from the centre of the stadium.

2 · Create your own stadium

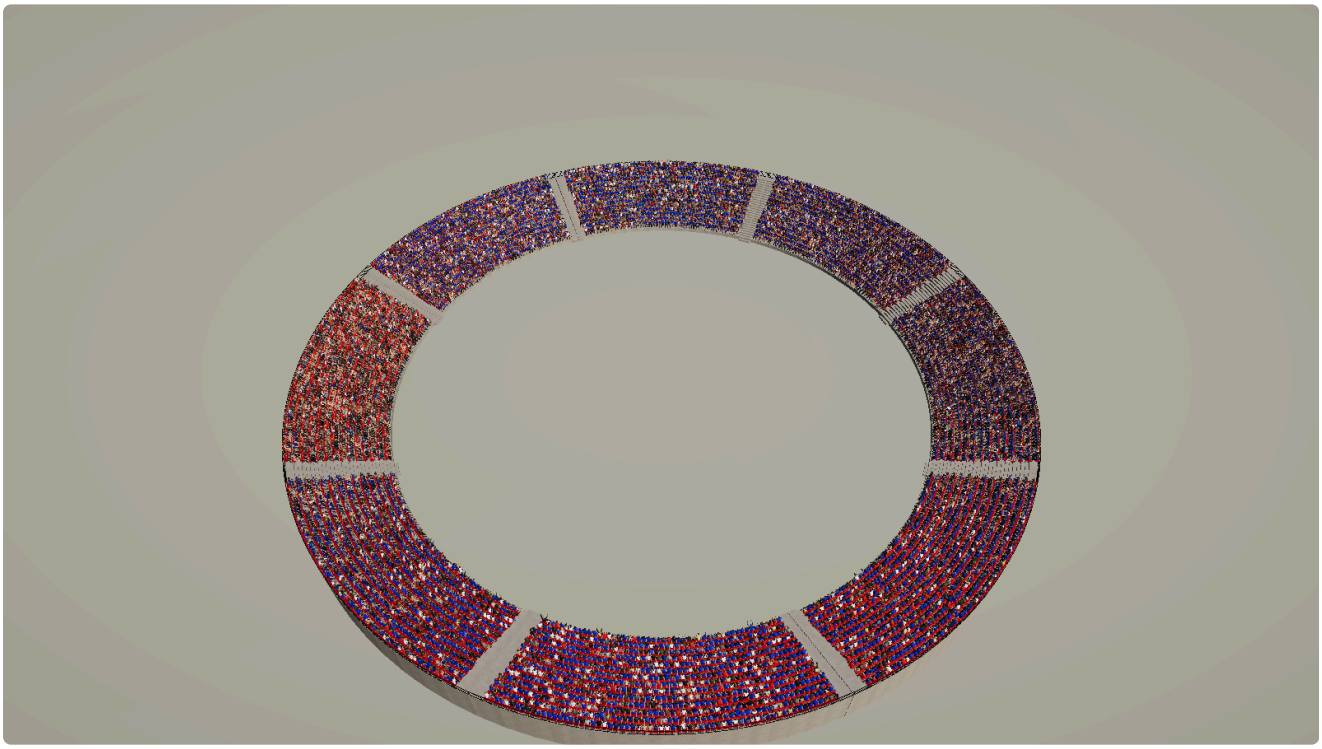

1. **Open the scene you want to work in** and choose **Tools** ▸ **Stadium Creator 2** ▸ **Create Stadium**. You can also right-click in the Hierarchy and pick **Stadium Creator 2** ▸ **Stadium**. A Stadium appears in front of the Scene view camera with one small grandstand of 5 rows × 10 seats, already filled with people.

2. **Select the grandstand** (the child called *Grandstand 1*). Drag the **Rows** and **Columns** sliders to resize it. The stand and the crowd update as you drag.

3. **Pick a style.** Classic has bucket seats on stepped tiers, Wooden Bleacher and Steel Bleacher are benches on a steel frame, and Concrete Slabs are steps people sit on directly. Railings and aisle stairs can be switched on or off.

4. **Curve it.** Move the **Curve** slider right to wrap the stand around the field, or left to bend it away.

5. **Add more stands.** Click **Add Grandstand Beside**. The new stand copies the current one and continues along the same line and curve, so a handful of clicks closes a full bowl. Each stand can then be edited, moved or rotated on its own.

Eight curved grandstands added one after another with Add Grandstand Beside.

3 · Make it your crowd

Select the **Stadium**. Under *Crowd* you can set the overall density, the colours and pattern of the home and away kits, and how many fans support the home side. Each grandstand also has its own **Density**, **Team** and **Standing Bias**, which is handy for an away end or a section of standing ultras.

4 · React to your game

Drive the crowd from any script. Mood changes ripple through the stands with natural, staggered reactions:

```
using AiKodex.StadiumCreator2;

// everyone in the scene
CrowdManager.SetEmotion(CrowdEmotion.Anticipating, 1f);

// a goal: celebrate for 8 seconds, spreading from the goal mouth, then go back to the previous
mood
stadium.TriggerReaction(CrowdEmotion.Celebrating, 1f, 8f, goalPosition, 40f);
```

> **Tip.** A stadium of 20,000 spectators costs about the same CPU time as a stadium of 200. All the work happens on the GPU, so build big. The Manual's performance chapter explains how to tune level of detail and shadows for lower-end hardware.

That's it! For every setting, the scripting API and troubleshooting, see **Stadium Creator 2 – Manual.pdf**.
